

Does MicroSolv sell bared fused capillaries for CZE that are completely UV-transparent - FAQ

No, all of our **CE** capillaries are coated with polyimide. This polymer imparts structural rigidity to the capillary but has the disadvantage of being non-UV-transparent.

Without the coating, the capillary would be very brittle and will break easily. However, this does not present a problem in typical usage since you only need a small portion of the capillary to be UV-transparent for the detection window. This can be accomplished using our [Window Maker™](#) product.
