
Does MicroSolv Offer a Low Adsorption Tubing Suitable for Protein Analysis? FAQ

The closest tubing we recommend would be low pressure use, [FEP](#) or [PTFE](#). PTFE has micro-pores, and proteins may 'creep' in there. FEP is preferred because it has the same chemical stability but without the micro-pores.

However, you would have to test it for your proteins as we could not guarantee it would be appropriate for every protein application. Aside from that, the only dedicated low-adsorption tubing would use a special surface pre-treatment, which we do not carry amongst our products.
