

## Where a static mixer for HPLC instruments should be placed - Tips & Suggestions

Static mixers are designed to reduce detector noise associated with heterogeneity of multiple mixed solvent sources by mixing more thoroughly than can be accomplished with a proportioning valve in the HPLC instrument.

The best place for the static mixer is after the solvents have been mixed by the instrument but before the sample has been injected.

*You would simply remove the tubing from the pump assemblage outlet and insert the static mixer between these two components.*
