

## D and L Ascorbic acid Separation Analyzed by HPLC- AppNote

## **An Analysis of Vitamin C**

Click HERE for Column Ordering Information.

This simple Method shows good separation between two Enantiomers as well as Retention, considering these Acids both have a – 1.6 log p. This Method is Robust as results were verified with three different HPLCs and two separate Columns, all showing excellent Resolution of these two Acids.

## **Peaks:**

1. D- Isoascorbic acid

2. L- Ascorbic acid

## **Method Conditions**

**Column:** Cogent Diamond Hydride<sup>™</sup>, 4μm, 100Å

**Catalog No.:** 70000-10P

**Dimensions:** 4.6mm x 100mm

Mobile Phase: 98% Acetonitrile 2% DI Water / 0.1% Formic Acid

 $\textbf{Flow Rate} \colon 1.0 \text{mL} \: / \: \text{minute}$ 

Injection Volume: 1uL

**Detection**: UV 254nm

Injection vol.:  $1\mu L$ 

**Sample Preparation:** D- Isoascorbic Acid and L- Ascorbic Acid in 1.0 mg/mL in diluent of 50% Acetonitrile / 50% DI Water (v/v)

**t0:** 1.20 Minutes

**K1:** 0.39

**K2:** 0.62

**α:** 1.59

Note: Ascorbic acid exists as two enantiomers (mirror-image isomers), commonly denoted "l" (for "levo") and "d" (for "dextro"). The l isomer is the one most often

encountered and occurs naturally in many foods, and is one form of Vitamin C, an essential nutrient for many animals. Deficiency of Vitamin C causes scurvy. Vitamin C is used as a food additive and a dietary supplement for its antioxidant properties. The "d" form can be made via chemical synthesis but has no significant biological role.

Capacity Factor – Relative Retention k = (tR-t0)/t0 $\alpha = K2/K1$
